(a) Outcomes at threshold ($m = 1$, $n = 4$, $x = 0.9$)
$k = 1$ at $\phi^* = 0.722$
$k = 2$ at $\phi^* = 0.195$
replications
reliability ρ of one replication
(b) Hub regions: random vs targeted shocks
theory, $k = 1$
theory, $k = 2$
random, $k = 1$
random, $k = 2$
targeted, $k = 1$
targeted, $k = 2$
reliability outside hit regions
supply-weighted share of clusters hit ϕ_s
(c) The diversification trap
$m = 1, n = 4, k = 2$
$m = 1, n = 6, k = 3$
$m = 2, n = 6, k = 3$
$m = 3, n = 4, k = 2$
collapse threshold ϕ^*
supplier clusters c (1 = co-located)
